WEEK1

print() : an in-built function that displays things given inside parantheses
eg. print("Hello World") → Hello World

- Escape sequence : \n starts a new line and \t inserts a tab space
- Comments : They are for human interpretation of the code, indicated by #
  eg. #the code starts here.
- variable : name for a value eg. limit = 100.0
- type() : in-built function that gives type of the stored object eg. type(limit) → float
- Arithmatic : / gives float, // gives the integer part, % gives remainder.
- f-strings : They help us display the objects without ending the string.
  eg. print(f"The limit is {limit}")
